

CSV CLEANUP / ORIGINAL DEMONSTRATION

Orderly

Messy exports.
Traceable decisions.

I built a CSV review workflow that separates safe normalization from decisions that need attention. Every accepted or flagged record retains its original source line.

My work
React interface, TypeScript validation, exact-cent calculations, exception inspection and a companion standard-library Python script.

Try it
Inspect a flagged row. Change the input and rerun the review, then compare accepted records with the status totals.

Try the live workbench

Python source

ACTUAL LIVE INTERFACE / FICTIONAL ORDER DATA

Every record accounted for
12 input records = 6 accepted + 6 flagged. Rejected values remain available with reasons.

Exact, separate totals
Paid USD 89.75; pending USD 19.95; refunded USD 9.00. Only accepted paid rows count toward the paid total.

Reproducible evidence
8 Python tests and 12 browser-model tests. The included sample matches all published Python outputs. Source and expected results are included.
